4 Tests

1. Can a divergent lens produce an inverted image?

a. Yes, if the object is in the focal point.

b. Yes, if the object is between the focal point and the optical center of the lens.

c. Yes, if the object is at the same distance as the image.

d. No, it cannot.

2. Let us consider a ray of light passing through the focal point of a divergent lens:

a. It passes also through the other focal point.

b. It is not deviated in a significant way from the straight trajectory.

c. The refracted ray is parallel to the optical axis.

d. None of the previous answers is correct.

3. When we use the conjugated point formula for a divergent lens:

a. p is negative, q and f are positive.

b. p can be positive or negative, f and q are positive.

c. p, q and f are negative.

d. p is positive, q and f are negative.

4. If the focal length of a lens is -20 cm, which is its diopter power?

a. 5 diopters.

b. -5 diopters.

c. -20 diopters.

d. 20 diopters.

5. Consider a divergent lens: in which of the following situations is the image real and enlarged in size?

a. When the object is at the focal point of the lens.

b. When the object is very far from the lens.

c. When the object is at the curvature center.

d. Never.
